

Fiverr Project Brief: Health Facility Locator

Outsourced Feature Specification & Developer Contract Guidelines

1. Project Overview & Objective

This document serves as the complete, copy-pasteable Fiverr project brief for outsourcing the **Health Facility Locator** feature. The objective is to integrate the **Google Maps API** into an existing application to assist users in locating nearby healthcare facilities (hospitals, clinics, laboratories, and pharmacies) based on real-time location detection, with specialized filtering capabilities.

FIVERR JOB TITLE (Copy & Paste)

Full-Stack / Mobile Developer: Build Health Facility Locator with Google Maps API Integration

2. Key Functional Requirements

A. Google Maps API Integration

- **Location Detection:** Automatically detect and request permission for user GPS coordinates to auto-center the interactive map canvas.
- **Dynamic Mapping:** Render interactive facility markers with custom visual pins representing nearby medical centers.
- **Facility Metadata Card:** Display essential information (facility name, address, distance, operating hours, contact) upon selecting a map marker.

B. Facility Category Filtering

- Provide intuitive category filter toggles for four primary healthcare facility types:
 - **Hospitals:** Full-service inpatient and emergency medical facilities.
 - **Clinics:** Outpatient primary care and specialty medical centers.
 - **Laboratories:** Diagnostic testing and clinical specimen collection centers.
 - **Pharmacies:** Prescription dispensing and retail medicine outlets.

C. Medical Service-Level Filtering

- Allow multi-attribute search filtering based on specific specialized medical services offered:
 - **Immunization:** Facilities offering routine, pediatric, or travel vaccinations.
 - **Radiology:** Facilities offering diagnostic imaging (X-Ray, Ultrasound, CT/MRI).
 - **Custom Services:** Extensible database query support for additional medical specialties.

3. Technical & Version Control Workflow

- **Version Control:** Development must occur exclusively within the assigned **GitHub or GitLab repository**.

- **Branching Strategy:** Developers must create feature branches and submit Pull Requests (PRs) referencing assigned Task IDs.
- **Code Quality:** Source code must be clean, modular, documented, and pass automated linting checks prior to PR approval.

4. Project Management & Tracking

- **Google Sheet Integration:** Time tracking, deadline adherence, and cost breakdowns will be monitored jointly via a shared Google Sheet.
- **Milestone Updates:** Developer must update task status dropdowns and log actual hours against project placeholders.

5. Deliverables & Acceptance Criteria

Deliverable	Description	Acceptance Criteria
Locator Feature Codebase	Fully integrated Health Facility Locator frontend & backend module.	Google Maps canvas renders accurately; real-time GPS detection works; category filters (Hospitals, Clinics, Labs, Pharmacies) and service filters (Immunization, Radiology) update pins smoothly.
Repository Deliverables	Source code pushed to assigned GitHub/GitLab repo.	Clean, commented code structured into feature branches; all PRs reference corresponding Task IDs (TSK-01 to TSK-05).
Progress & Expense Logs	Updated tracking status inside shared Google Sheet.	Completion percentages, hour logs, and milestone status accurately recorded according to agreed delivery timeline.

6. Application Requirements for Freelancers

When submitting a proposal on Fiverr, candidates must include:

1. Portfolio links demonstrating prior experience with Google Maps API integrations and location-based search filtering.
2. Recommended tech stack for frontend UI and backend spatial database querying.
3. Proposed timeline and milestone cost breakdown matching project requirements.
