01 / 04 About the client

E Health Company that is based in Nigeria

02 / 04 Health Facility Locator

We need a Health Facility Locator feature integrated with the Google Maps API. It should help users find nearby hospitals, clinics, laboratories, and pharmacies, filter results by facility type and available healthcare services, view facility information, and access directions.

03 / 04 Feature Requirements

- Integrate Google Maps and display nearby health facilities using the user's location.
- Filter facilities by hospitals, clinics, laboratories, and pharmacies.
- Filter by available services, including immunisation and radiology.
- Let users select a facility and view relevant information and its location.
- Provide access to directions to the selected facility.

NOTE

The feature will be added to an existing eHealth platform. The technology stack and application architecture are not being disclosed at this assessment stage.

Facility and service information will come through the project's agreed data source. The feature should support displaying, searching, and filtering that data by facility type and available services; the developer should identify technical dependencies and information needed before development begins.

04 / 04

Deliverables & Workflow

- Completed Health Facility Locator feature and Google Maps integration.
- Location-based facility search, facility-type and service filters, facility information display, and directions functionality.
- Source code submitted through the agreed GitHub/GitLab repository, with regular commits and clear commit messages.
- Relevant documentation and testing of the completed feature.
- Work managed through agreed milestones and progress updates covering completed work, work in progress, outstanding tasks, and technical challenges or blockers.
- Review against the agreed requirements before final acceptance.
